

Lachenmeier presents a revolution in packaging technology!

Lachenmeier: By tradition, few companies are more keenly anticipated as exhibitors at Interpack than we are. The 2008 trade fair will be no exception. Lachenmeier was the first to introduce a fully automatic stretch hood machine at the trade fair Total in 1989 in England. At this year's exhibition, Lachenmeier will be demonstrating how far we have progressed. We will be presenting the new Power Flex T1 stretch hood machine.

Come and see 3 x savings on just one machine! Visit Lachenmeier: Booth 12C47 at Interpack 2008 from 24. – 30. April in Düsseldorf, Germany.

Lachenmeier, one of the world's leading, most innovative producers of end-of-line packaging machinery, will demonstrate at Interpack, how our expertise within stretch hood technology has yielded cash advantages for the industries using this packaging technology as part of their production. Stretch hood packing means cost-effective, flexible and reliable handling of sacks, appliances, paper, food and beverage products, packaging and building materials, etc.

Saving energy

We are living in an era where it pays to save on energy. At Lachenmeier we take energy-saving seriously: We will be presenting our new Power Flex T1 stretch hood machine which can save you a great deal of money and energy. The machine has a completely new construction design which we look forward to showing you. Just tell us how you have been packing your products until now. You will be surprised just how big your savings can be.

Saving space in the packing area

Small is efficient. Every square metre of packing area costs you money. Lachenmeier has made special effort to save space. Size-wise, the Power Flex T1 can only be described as a revolution and, like all Lachenmeier packaging machines, its power is also revolutionary.

Saving time on installation and service

A machine that is small in size and huge in effect. Power Flex T1 is Lachenmeier quality down to the very last detail. Meticulous design means that installing the new stretch hood machine in the packing area is unusually fast and easy. Further, the machine's logical construction gives service technicians easy access. Service is reduced to a few, quick tasks.

Experience the Multi Flex stretch hood 6th generation too.

Healthy families produce healthy children. The Multi Flex stretch hood operates with multiple loads and sizes. The sixth generation of this machine can be experienced at Interpack 2008. This machine is calibrated for use with more or less all kinds and all sizes of products. With an extremely high packing rate of up to 200 pallets per hour, we are proud to announce that energy consumption on this machine too is reduced.

Lachenmeier acquired by ITW

In 2007 Lachenmeier was acquired by ITW (Illinois Tool Works), USA. The combination of Lachenmeier know-how and experience in many markets and ITW's presence in the North American, European and Asian markets has opened up for an even broader global presence. Lachenmeier now has a solid financial platform for improved and more equal partnership with our customers. We will be investing in our supply chain, service network and product development. Lachenmeier has become an independent business unit within ITW.
